

Abstract of the Disclosure

INPUT/OUTPUT INTERFACE CONTROL

- [26] A method and apparatus for controlling a parameter of at least one signal. The method and apparatus includes receiving a desired command signal from at least one control input, determining a potential condition for receiving an undesired command signal from at least one other control input, activating a desired command as a function of the desired command signal, and controlling a parameter of a signal from the at least one other control input in response to the potential condition.
